

ecCodes BUFR decoding

Fortran 90 and Python API – part 1

Marijana Crepulja

© ECMWF February 2019

Introduction:

- Fortran 90 subroutines to decode BUFR data
- Python subroutines to decode BUFR data
- Practical examples

Fortran API: Decoding

Fortran API: Decoding

- Open a file according to a mode

```
call codes_open_file (file, filename, mode, status)
```

file: the opened file to be used in all file functions

filename: name of the file to be opened

mode: open mode can be 'r' (read) or 'w' (write)

status: CODES_SUCCESS if OK, integer value on error

Input arguments

Output arguments

- Close a file

```
call codes_close_file (file, status)
```

file: the file to be closed

status: CODES_SUCCESS if OK, integer value on error

Fortran API: Error handling

- In case of error, if the `status` parameter (optional) is not given, the program will exit with an error message.
- The error message can be gathered with `codes_get_error_string`.

```
if (status /= 0) then
    call codes_get_error_string (status, err_msg)
    print*, 'ecCodes Error: ', trim(err_msg), ' error=', status
    stop
end if
```

- Error codes are listed under:
http://download.ecmwf.int/test-data/eccodes/html/group_errors.html

Fortran API: Decoding

- Load in memory a message from a file

```
call codes_bufr_new_from_file (file, ibufr, status)
```

file: the file opened with `codes_open_file`

ibufr: id of the message loaded in memory

status: CODES_SUCCESS if OK, CODES_END_OF_FILE at the end of file, or error code

Input arguments

Output arguments

The message can be accessed through its message ID and it will be available until `codes_release`.

- Release a BUFR message

```
call codes_release(ibufr, status)
```

ibufr: the id of the message to be released

status: CODES_SUCCESS if OK or error code

Fortran API: Decoding

- Get the value of the key in the message

```
call codes_get (ibufr, key, value, status)
```

ibufr: id of the message loaded in memory

key: key of a variable

value: values of variable/array

status: CODES_SUCCESS if OK, or error code

Input arguments

Output arguments

value can be a integer(4), real(4), real(8) or a character.

Type of the returned values depend on the variable declaration.

```
integer (kind=4) :: integer_values  
real (kind=8) :: real_values  
character (len=string_size) :: string_values
```

Fortran API: Decoding

- This function supports the **allocatable** array attribute.

```
call codes_get (ibufr, key, value, status)
```

Input arguments
Output arguments

Type of the returned **value** depend on the array declaration.

integer (kind=4),	dimension(:), allocatable :: integer_array
real (kind=8),	dimension(:), allocatable :: real_array

if(allocated(array)) deallocate(array)

Fortran API: Decoding

- Get values of string array

```
call codes_get_string_array (ibufr, key, value, status)
```

`ibufr`: id of the message loaded in memory

`key`: key of a variable

`value`: values of variable/array

`status`: CODES_SUCCESS if OK, or error code

Input arguments

Output arguments

Type of the returned `value` depends on the array declaration.

```
character (len=string_size), dimension(:), allocatable :: string_array
```

! The array of strings must be allocated before it is passed to `codes_get_string_array`

```
allocate (string_array)
```

! Remember to deallocate

```
if(allocated(string_array)) deallocate(string_array)
```

Fortran API: Decoding

- Getting number of subsets in the message

```
call codes_get(ibufr,'numberOfSubsets',numberOfSubsets)
```

Input arguments
Output arguments

- Getting master table version number

```
call codes_get(ibufr,'masterTablesVersionNumber', masterTablesVersionNumber)
```

- Getting values of expanded descriptors

```
call codes_get(ibufr, 'expandedDescriptors', value, status)
```

- Getting originating Centre

```
call codes_get(ibufr, 'bufrHeaderCentre', value, status)
```

Fortran API: Decoding

- We need to instruct ecCodes to unpack the data section

```
call codes_set(ibufr, 'unpack', 1)
```

Input arguments
Output arguments

Note: If you do not set 'unpack' and want to read the data section, ecCodes returns
ECCODES ERROR : get: latitude Key/value not found

Fortran API: Missing values

- Each element in the data section of a BUFR can be missing.
- ecCodes provides a simple way for the user to check if the value of an element is missing by comparing with two constants:

`CODES_MISSING_LONG` for integer values

`CODES_MISSING_DOUBLE` for real values

The constants are available in Python, Fortran 90 and C and the user needs to compare with the appropriate constant depending on the type of the variable used.

Fortran API: Missing values

- Declare value as double precision

```
real(kind=8), dimension(:), allocatable :: value
```

- Get the values

```
call codes_get(ibufr, 'key', value)

do i=1,size(value)
    ! compare with double precision missing
    if (value(i) /= CODES_MISSING_DOUBLE) then
        ! process non missing values
    else
        ! process missing values
    endif
end do
```

Fortran API: Decoding example

```
call codes_open_file(file,'filename','r')
    call codes_bufr_new_from_file(file,ibufr,status)
do while (status/=CODES_END_OF_FILE)
    ! Read the BUFR headers info
    call codes_get(ibufr,'numberOfSubsets',numberOfSubsets)
    ! unpack the data values
    call codes_set(ibufr,"unpack",1)
    ! Read the data section
    call codes_get(ibufr,'latitude',lat)
    ! Release the message
    call codes_release(ibufr)
    ! Load the next message
    call codes_bufr_new_from_file(file,ibufr,status)
end do

call codes_close_file(file)
```

Input arguments
Output arguments

Python API: Decoding

Python API: Decoding

Input arguments
Output arguments

- Open the input BUFR file

```
file = open(filename, 'rb')
```

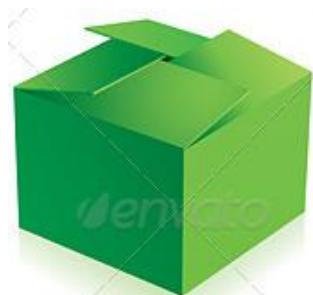

file: the opened file to be used in all file functions
filename: name of the file to be opened

- Close the BUFR file

```
file.close()
```

file: the file to be closed

Python API: Decoding

- Load in memory a message from a file

```
ibufr = codes_bufr_new_from_file(file)
```

file: the file opened with `codes_open_file`

ibufr: id of the message loaded in memory

The message can be accessed through its message ID in all ecCodes function calls and it will be available until `codes_release`

- Free the memory for the message referred to by ibufr

```
codes_release(ibufr)
```

Input arguments
Output arguments

Python API: Exception handling

All ecCodes functions throw the following exception on error: **CodesInternalError**
This is the base class for all other exceptions. The full list is here:

<https://confluence.ecmwf.int/display/ECC/Python+exception+classes>

try:

```
example(output_filename)
```

except CodesInternalError as err:

```
    sys.stderr.write(err.msg + '\n')
```

Python API: Decoding

- Get the value of a scalar from a message

```
value = codes_get(ibufr, key)
```

ibufr: id of the message loaded in memory

key: key of the variable

value: value of variable

Input arguments

Output arguments

- Get the array values of a variable from a message

```
value = codes_get_array(ibufr, key)
```

ibufr: id of the message loaded in memory

key : key of the variable

value: an array as a NumPy array.

Type of the value can be integer, float or str.

Python API: Decoding

- Getting the number of subsets in the message

```
numberOfSubsets = codes_get(ibufr, 'numberOfSubsets')
```

Input arguments
Output arguments

- Getting the master table version number

```
masterTablesVersionNumber = codes_get(ibufr, 'masterTablesVersionNumber')
```

- Getting values of expanded descriptors

```
expandedDescriptors = codes_get(ibufr, 'expandedDescriptors')
```

- Getting originating Centre

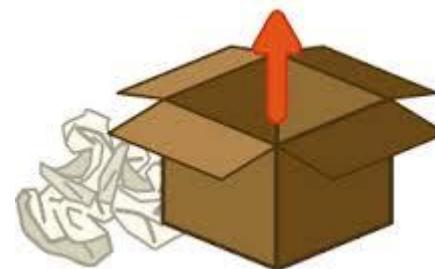

```
centre = codes_get(ibufr, 'bufrHeaderCentre')
```

Python API: Decoding

- We need to instruct ecCodes to unpack the data section

```
codes_set(ibufr, 'unpack', 1)
```

'unpack' to read
data section

Input arguments
Output arguments

Note: If you not set 'unpack' and want to read data section ecCodes returns
ECCODES ERROR : get: latitude Key/value not found

Python API: Decoding example

```
file = open(filename, 'rb')

# loop over the messages in the file
while 1:

    ibufr = codes_bufr_new_from_file(file)
    if ibufr is None:
        break

    # Read the BUFR headers info
    numberOfRowsSubsets = codes_get(ibufr, 'numberOfSubsets')
    # unpack the data values
    codes_set(ibufr, 'unpack', 1)

    # Read the data values
    airTemperature = codes_get(ibufr, 'airTemperature')

    codes_release(ibufr)
file.close()
```

Input arguments
Output arguments

Set up environment

- F90 interface
`use eccodes`
- Python interface
`from eccodes import *`
- At ECMWF environment variables `ECCODES_INCLUDE` and `ECCODES_LIB` are used for compiling C and Fortran programs.

Compile and run the program

- Fortran 90 interface

```
gfortran -o myprogram myprogram.f90 \
$ECCODES_INCLUDE $ECCODES_LIB
./myprogram
```

- Python interface

```
python myprogram.py
```

Practical

- Navigate to your \$SCRATCH

```
cd $SCRATCH
```

- Copy the material for the practical

```
cp -r ~trx/ecCodes/2019/bufr_api_decode ./
```

- There are subdirectories for F90 and python

```
cd F90
```

```
cd python
```

- The directories are named by practical number

```
e.g. cd bufr_decode_practical1
```

- Have a look at the README

- Have fun

Practical 1: Decode SYNOP data

1. Open the **synop.bufr** file in read mode
2. Load message
3. Loop over messages
4. Decode and print:
 - unexpandedDescriptors
 - expandedDescriptors
5. '**unpack**' the data section
6. Decode and print:
 - latitude
 - longitude
 - airTemperature
7. Release the message
8. Close the BUFR file

`codes_open_file`

`codes_bufr_new_from_file`

`codes_set (ibufr,'unpack',1)`

`codes_get`

`codes_release`

`codes_close_file`

What happens if you do not set 'unpack'?

Accessing value by rank

Fortran API

- Reading value of variable by rank

```
call codes_get(ibufr, '#2#key', value, status)
```

Input arguments
Output arguments

Python API

- Reading value of variable by rank

```
height = codes_get (ibufr, '#2#height' )
```

- Reading array values of variable by rank

```
latitude = codes_get_array (ibufr, '#2#latitude' )
```

Practical 2: Decode TEMP data

1. Open **temp.bufr** in read mode
2. Load message
3. Loop over messages
4. ‘**unpack**’ the data section
5. Get values for:
 - ‘shipOrMobileLandStationIdentifier’
 - ‘latitude’
 - ‘longitude’
 - ‘height’
6. Using accessing variables by rank to decode the second **windSpeed** and **windDirection**
7. Release the message
8. Close the BUFR file

`codes_open_file`

`codes_bufr_new_from_file`

`codes_set (ibufr,'unpack',1)`

`codes_get`

`codes_release`

`codes_close_file`

Practical 3: Decode SYNOP data

1. Open the **synop_2messages.bufr** in read mode
2. Load the messages in memory
3. Loop over messages
4. ‘**unpack**’ the data section
5. Decode and print:
- **‘stationOrSiteName’**
6. Release the message
7. Close the BUFR file

In Fortran API

character (len=string_size), dimension(:), allocatable :: stationOrSiteName

! The array of strings must be allocated before is passed to codes_get_string_array

```
call codes_get_size(ibufr,'stationOrSiteName',n)
allocate(stationOrSiteName(n))
```

codes_open_file

codes_bufr_new_from_file

codes_set (ibufr,'unpack',1)

codes_get

codes_release

codes_close_file

Practical 4: Decode SYNOP data

1. Open the `synop_with_confidence.bufr` in read mode
2. Load the messages in memory
3. Loop over messages
4. ‘unpack’ the data section
5. Decode and print:
 - **‘nonCoordinatePressure’**
 - its **‘percentConfidence’**
6. Release the message
7. Close the BUFR file

How to access confidence??

Use the key 'nonCoordinatePressure->percentConfidence'

`codes_open_file`

`codes_bufr_new_from_file`

`codes_set (ibufr,'unpack',1)`

`codes_get`

`codes_release`

`codes_close_file`

A central word cloud is formed by the words "thank" and "you" in large blue letters. Surrounding this center are numerous other words in various colors, each representing a different language's expression of gratitude. The languages include German ("danke"), Chinese ("謝謝"), English ("thank you"), Spanish ("gracias"), French ("merci"), Italian ("grazie"), Portuguese ("obrigado"), Russian ("спасибо"), Polish ("dziękuje"), Dutch ("bedankt"), and many others from around the world.

Some examples of the surrounding text include:

- Top left: "спасибо" (Russian)
- Middle left: "спасибо" (Russian), "Баярлалаа" (Mongolian), "faafetai lava" (Somali), "dankie" (Afrikaans), "dhanyavad" (Hindi), "hvala" (Croatian), "mauruuru" (Swahili), "köszönöm" (Hungarian), "enkosi" (Swati), "nani" (Lithuanian), "nanti" (Indonesian), "kiitos" (Finnish), "dank" (Danish).
- Bottom left: "obrigado" (Portuguese), "sobodi" (Georgian), "dékiji" (Korean), "mèsi" (Lao), "sagolun" (Burmese), "najis tuke" (Malay), "kam sah hamnida" (Khmer), "rahmat" (Urdu), "terima kasih" (Indonesian), "গোবিন্দ ধন্যবাদ" (Bengali).
- Bottom center: "감사합니다" (Korean), "xièxie" (Chinese), "ευχαριστώ" (Greek), "diolch" (Welsh), "dhanyavadagalu" (Kannada), "shukriya" (Malayalam), "merci" (French), "merci" (Spanish), "merci" (Portuguese), "merci" (Italian), "merci" (Russian).
- Right side: "tapadħ leat" (Maltese), "хвала" (Ukrainian), "asante" (Swahili), "manana" (Swahili), "obrigada" (Portuguese), "zaxx" (Maltese), "tenki" (Swati), "mochchakkeram" (Malay), "mamnun" (Arabic), "chokrang" (Burmese), "murakze" (Maltese), "trugarez" (Welsh), "дякую" (Ukrainian), "arigatō" (Japanese), "grazie" (Italian), "raibh" (Irish), "maith agat" (Irish), "go" (Irish), "takk" (Maltese), "dakujem" (Croatian), "trugarez" (Welsh), "merci" (French), "merci" (Spanish), "merci" (Portuguese), "merci" (Italian), "merci" (Russian).
- Top right: "ngiyabonga" (Xhosa), "tesekkür ederim" (Turkish), "dank je" (Dutch), "misaotra" (Swahili), "matondo" (Swahili), "paldies" (Latvian), "grazzi" (Italian), "mahalo" (Hawaiian), "tapadħ leat" (Maltese), "хвала" (Ukrainian), "asante" (Swahili), "manana" (Swahili), "obrigada" (Portuguese), "zaxx" (Maltese), "tenki" (Swati), "mochchakkeram" (Malay), "mamnun" (Arabic), "chokrang" (Burmese), "murakze" (Maltese), "trugarez" (Welsh), "дякую" (Ukrainian), "arigatō" (Japanese), "grazie" (Italian), "raibh" (Irish), "maith agat" (Irish), "go" (Irish), "takk" (Maltese), "dakujem" (Croatian), "trugarez" (Welsh), "merci" (French), "merci" (Spanish), "merci" (Portuguese), "merci" (Italian), "merci" (Russian).
